IDENTITY_NUC Gapop 10.0 , Gapext 1.0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

8**3**3333333333

The sequence is that encoding an Ms45 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably Ms45), which encodes a product selected from auxing, rolB and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       문
                     The sequence is that encoding an M845 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably M845), which encodes a product selected from auxins, rolB and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile and infertile plants
                                                                                                                                                                            New nucleic acid encoding a M845 male tissue-preferred regulatory region - useful in mediating plant fertility, especially hybrid seed production.
                                                                                                                                                                                                                                                                                                                                                                                                                     M845; male; tissue-preferred; plant tissue; differentiated;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     08-JUN-1999

Claim 4; Page 46; 50pp; English.

A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.

The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription of the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene inpacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a nucleic acid sequence encoding an Ms45 male tissue preferred regulatory region from 2. mays

A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a nucleic acid sequence encoding an Ms45 matissue preferred regulatory region from Z. mays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A male tissue-preferred regulatory region essential for initiating transcription of mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13-FEB-2001; 2001WO-US004527

A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a DNA fragment -38 to -195 bases upstream of the TATA box of a Z. mays MS45 male-tissue preferred regulatory region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A male tissue-preferred regulatory region essential for initiating transcription of mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 5; Page 47; 50pp; English.

                                                                                         The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence conditions are also useful form from the US patent office at the sequence introduced are consistent of the superior conference than 1700-013-2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as construction are also useful in physical arrays of molecules and as construction of the invention are also useful in physical arrays of molecules and as construction of the conditions, pathogens or pests, for manipulating growth rate in commodification of the cell cycle pathway, for conferring concreased resistance to plant disease, for producing galactomanan, in construction of the cell cycle pathway, for conferring concreasing the rate of homologous concreased resistance to plant disease, for producing galactomanan, construction of the condition of the cell cycle pathway, for conferring construction of the construction of the cell cycle pathway. For conferring construction of the cell cycle pathway, for conferring construction of the cell cycle pathway. For conferring construction of the cell cycle pathway, for conferring construction of the cell cycle pathway. For conferring construction of the cell cycle pathway, for conferring construction of the cell cycle pathway. For conferring construction of the cycle pathway, for conferring content. This sequence represents a plant full length insert construct of the cycle pathway cy

Conservative

of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, harbicides, extreme comotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lighin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide for the polynucleotide for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc polynucleotide consisting of a sequence encoding an amino acid sequence cavailable in electronic form from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide cf the seqdata.uspto.gov/sequence.html?DocID:2014034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as improving plant tolerance to cold, heat, drought, herbicides, extreme combinit conditions, pathogens or pests, for manipulating growth rate in collant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, cc lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake cor by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert to fithe collynucleotide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polymerically preventing breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     14-JAN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5
                     The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (S1). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequence given in records ACN78851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web site at seqdata.uspto.gov/sequence.html?DocID=2003009974
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ACN85231;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Breast cancer related marker,

New polynucleotides, specifi flowering locus T gene (FT) homologs, useful for floral specifically nucleic acid fragments encoding ne (FT) or terminal flower' (TFL), or Apetala3 (Ap3) floral development, e.g. engineering plant flowering

Claim 6; SEQ ID NO 63; 109pp; English.

CC The present invention describes an isolated polynucleotide comprising a CC first, second, third, fourth or fifth nuclectide sequence, or their complement encoding a polypeptide either having flowering locus T gene (FT), terminal flower (TFL), or Apetala (Ap3) homologue activity. Also CC described: (1) a vector comprising the polynucleotide; (2) a recombinant CC DNA construct; (5) producing a plant comprising the polynucleotide; (3) transforming a cell by crecombinant DNA construct; (5) producing a plant comprising three comprising three comprising transforming a plant cell with the polynucleotide; (4) a cell comprising the construct; (7) a seed comprising the recombinant DNA construct; (7) a seed comprising the recombinant DNA construct; (8) an accombinant DNA construct; (9) an isolated polynucleotide sequence comprising a first nucleotide sequence, where the first nucleotide sequence is comprised by another polynucleotide, where the comprised the second, third, fourth, fifth or six nucleotide sequence; (9) an isolated polypeptide having FT or Ap3 construct; (9) an elected above; and (10) isolating a polypeptide cell containing a recombinant DNA construct; comprising the polypeptide from a cell containing a recombinant by another polynucleotide sequence; (9) an isolated polypeptide having FT or Ap3 containing a recombinant by another polynucleotide for a sequence comprising isolating the polypeptide from a cell containing a recombinant by another polynucleotide sequence cell containing a recombinant by another polynucleotide sequence appears the polynucleotide sequence appears the polynucleotide sequence are useful cfor first pulme, plant growth rate, inflorescence architecture, and tissue culture morphology and the rate of cell division to enhance cransformation. The present sequence represents an FT homologue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Scoring table:
                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic search, using sw model

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              can generate without further laboratory work. The draft assembly has been edited, and if possible, ends identified by vector as well as by BAC end sequences, and contigs ordered and oriented. Bases that are not Ns are either above Q20 or manually edited. This assembly was performed with Arachne (Genome Res. 2002 12: 177-189; Genome Res. 2003 13: 91-96). All trace files for this project are available at the NCBI trace repository (http://www.ncbi.nlm.nih.gov/Traces/trace.fcgi?). An exact list of reads used in this assembly are available at http://www.broad.mit.edu/annotation/plants/maize/randomclones.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 manually curated. It is the best representation of the BAC that we
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bharti, AK and Messing, J: The Plant Genome Initiative at Univers, Waksman Institute, Rutgers, The State University of New Jersey, 190 Frelinghuysen Road, Piscataway, NJ 08854, USA (http://pgir.rutgers.edu)

All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RM/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Birren, B., Nusbaum, C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ----- Project Information
                                                                                                                                                                                                                                                                                                                 consists of 6 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have
by the finished sequence as soon as it is available and the accession number will be preserved.

1 100617: contig of 100617 bp in length
100618 100717: gap of unknown length
100718 104730: contig of 4013 bp in length
                                                                                                                                                                                                                        provided by the submittor. This sequence will be replaced

It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                      Score

WPI, 1999-105628/09. New nucleic acid encoding a Ms45 male tissue-preferred regulatory region - useful in mediating plant fertility, especially hybrid seed production.	(PION-) PIONEER HI-BRED INT INC. Albertsen MC, Fox TW, Garnaat CW, Huffman GA, Kendall TL;	97; 97US-00880499.	98; 98WO-US012895.	98	-A1.		Ms45; male; tissue-preferred; regulatory region; plant cells; plant tissue; differentiated; maize; hybrid seed; fertility; ss.	Zea mays Ms45 male tissue-preferred regulatory region.	99 (first entry)		T 1 408 AAX07408 standard; DNA; 1394 BP.	

The sequence is that encoding an Ms45 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably Ms45), which encodes a product selected from auxins, rolB and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5
                                                The sequence is that encoding an Ms45 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably Ms45), which encodes a product selected from auxins, rolls and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile and infertile plants
                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding a M845 male tissue-preferred regulatory region - useful in mediating plant fertility, especially hybrid seed production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   M845; male; tissue-preferred; plant tissue; differentiated;

Oy 1 CCATGGTGTCTTATTACTGAATGAGTGAAAAAAAAAAAA	that involves introperably linked to operably linked to all the fertility of the gene. A method of gene. A method of requence represents referred regulator and BP; 411 A; 31	A male tissue-preferred regulatory region comprising nucleotide sequency researchal for initiating transcription of the MS45 gene useful for presential for initiating transcription of the MS45 gene useful for promediating fertility in a male plant. XX PS Claim 4; Page 46; SOpp; English. XX CC The invention provides a male tissue-preferred regulatory region (I) CC CC comprising nucleotide sequences essential for initiating transcription CC CC the MS45 gene. A method of mediating male fertility in a plant is	PR 15-FEB-2000; 2000US-00504487. XX PA (PION-) PIONEER HI-BRED INT INC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a nucleic acid sequence encoding an MS45 martissue preferred regulatory region from Z. mays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAH76333;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-OCT-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                 tion provides a male tissue-preferred regulatory region (I) nucleotide sequences essential for initiating transcription of gene. A method of mediating male fertility in a plant is hat involves introducing an expression vector comprising a perably linked to (I) into a plant where the exogenous gene ale fertility of the plant and (I) controls expression of the gene. A method of producing hybrid seeds is also provided. The squence represents a Z. mays Ms45 promoter fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ssue-preferred regulatory region comprising nucleotide sequences for initiating transcription of the MS45 gene useful for fertility in a male plant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription of the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a DNA fragment -38 to -195 bases upstream of the TATA box of a Z. mays MS45 male-tissue preferred regulatory region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A male tissue-preferred regulatory region essential for initiating transcription of mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ms45; male tissue; regulatory region; transcription; male fertility; hybrid seed; ds.

The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a recombinant DNA construct comprising a polynuclectide consisting of a sequence encoding an amino acid se available in electronic form from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynuc of the invention are also useful in physical arrays of molecules of the invention are also useful in physical arrays of molecules of the invention are also useful in physical arrays of molecules of the invention are also useful in physical arrays of molecules of the invention are also useful in physical arrays of molecules of the invention are also useful in physical arrays of molecules of the invention are also useful in physical arrays of molecules of the invention are also useful in physical arrays of molecules of the invention are also useful in physical arrays of molecules of the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are also useful as a constant and the invention are als
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens pests, for conferring increased resistance to plant disease, or for

CC The invention describes a recombinant DNA construct comprising a copynucleotide consisting of a sequence encoding an amino acid sequence cavailable in electronic form from the US patent office at.

Cf. ftp.segdata.uspto.gov/sequence.html?DpcID:2004034888. The polynucleotide cof the invention are also useful in physical arrays of molecules and as compound plant tolerance to cold, heat, drought, herbicides, extreme common the conditions, pathogens or pests, for manipulating growth rate in compound to the call cycle pathway, for conferring compound to plant settle should be call cycle pathway, for conferring conference to plant disease, for producing galactomannam, complete to plant growth and development under at least one combination or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert conjuncted that can be used in the recombinant DNA construct of the convention.

      The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US pattent office at ftp.seqdata.uspto.gov/sequence.html?DocID:200403488. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of
                                                                                                                                                                                                                           New recombinant DNA construct, useful for improving plant tol cold, heat, drought, herbicides, extreme osmotic conditions, pests, for conferring increased resistance to plant disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                galactomannan production;

The polynucleotide CC of the invention are also useful in physical arrays of molecules and as CC plant breeding markers. The recombinant DNA construct is useful for CC plant breeding markers to cold, heat, drought, herbicides, extreme CC osmotic conditions, pathogens or pests, for manipulating growth rate in CC plant cells by modification of the cell cycle pathway, for conferring CC increased resistance to plant disease, for producing galactomannan, CC lignin or plant growth regulators, for increasing the rate of homologous CC content on in plants, for improving yield by modification of CC photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake CC or by providing improved plant growth and development under at least one cutes condition or for modifying seed oil or protein yield and/or CC content. This sequence represents a plant full length insert CC polynucleotide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
